Quadratic Inequalities

Explore Graphing Quadratic Inequalities

- Online Activity Use graphing technology to complete the Explore.
 - INQUIRY How can you represent a quadratic inequality graphically?

Learn Using the Quadratic Formula

You can graph quadratic inequalities in two variables by using the same techniques used to graph linear inequalities in two variables. A quadratic inequality is an inequality that includes a quadratic expression.

Key Concept • Square Root Property

- Step 1 Graph the related function.
- Step 2 Test a point not on the parabola.
- Step 3 Shade accordingly.

Example 1 Graph a Quadratic Inequality (< or \le)

Graph $y \le x^2 - 2x + 8$.

Step 1 Graph the related function.

Because the inequality is less than or equal to, the parabola should be solid.

Step 2 Test a point not on the parabola.

$$y \le x^2 - 2x + 8$$

Original inequality

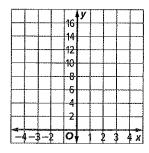

$$0 \le (0)^2 - 2(0) + 8$$

(x, y) = (0, 0)

True

Shade the region that contains the point.

Step 3 Shade accordingly.

acadeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee	***************************************

Think About It!

How do you know whether to make the parabola solid or dashed?

Study Tip:

(0, 0) If (0, 0) is not a point on the parabola, then it is often the easiest point to test when determining which part of the graph to shade.

Your Notes

Example 2 Graph a Quadratic Inequality ($> \text{ or } \ge$)

Graph
$$y > -5x^2 + 10x$$
.

Step 1 Graph the related function.

Because the inequality is greater than, the parabola should be dashed.

Step 2 Test a point not on the parabola.

$$y > -5x^2 + 10x$$

Original inequality

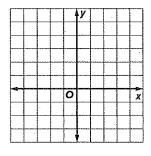

$$0 > -5(1)^2 + 10(1)$$

$$(x, y) = (1, 1)$$

So, (1, 0) is not a solution of the inequality.

Step 3 Shade accordingly.

Because (1, 0) is not a solution of the inequality, shade the region that does not contain the point.

Learn Solving Quadratic Inequalities

Key Concept · Solving Quadratic Inequalities

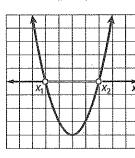

$$ax^{2} + bx + c < 0$$

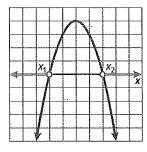

a > 0

a < 0

Graph $y = ax^2 + bx + c$ and identify the x-values for which the graph lies below the x-axis.

For ≤, include the x-intercepts in the solution.

$$\{x \mid x_1 < x < x_2\}$$

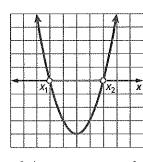

$$\{x \mid x_1 < x < x_2\}$$

$$ax^2 + bx + c > 0$$

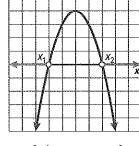

a > 0

Graph $y = ax^2 + bx + c$ and identify the x-values for which the graph lies above the x-axis.

For ≥, include the x-intercepts in the solution.

a < 0

$$\{x \mid x < x_1 \text{ or } x > x_2\}$$

$$\{x \mid x_1 < x < x_2\}$$

Go Online You can complete an Extra Example online.

Example 3 Solve a Quadratic Inequality (< or ≤) by Graphing

Solve $x^2 + 2x - 6 < 0$ by graphing.

Because the quadratic expression is less than 0, the solution consists of x-values for which the graph of the related function lies below the x-axis. Begin by finding the zeros of the related function.

$$x^2 + 2x - 6 = 0$$

Related equation

$$(x - \underline{\hspace{1cm}})(x + \underline{\hspace{1cm}}) = 0$$

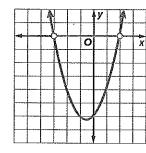

Factor.

$$x =$$
___ or $x =$ ___

Zero Product Property

Sketch the graph of a parabola that has x-intercepts at 2 or -3. The graph should open up because a > 0.

The graph lies below the x-axis between ____ and ____. Thus, the solution set is $\{x \mid \underline{\hspace{1cm}} < x < \underline{\hspace{1cm}} \}$ or in interval notation

Example 4 Solve a Quadratic Inequality (> or \ge) by Graphing

Solve $x^2 - 3x - 4 \ge 0$ by graphing.

Because the quadratic expression is greater than or equal to 0, the solution consists of x-values for which the graph of the related function lies on and above the x-axis. Begin by finding the zeros of the related function.

$$x^2 - 3x - 4 = 0$$

Related equation

$$(x - \underline{\hspace{1cm}})(x + \underline{\hspace{1cm}}) = 0$$

Factor.

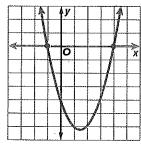

$$x =$$
 or $x =$

Zero Product Property

Sketch the graph of a parabola that has x-intercepts at -1 or 4.

The graph should open up because a > 0.

The graph lies above and on the x-axis when $x \le$ or $x \ge$ Thus, the solution set is $\{x \mid x \leq \underline{\hspace{1cm}} \text{ or } x \geq \underline{\hspace{1cm}} \} \text{ or } (\underline{\hspace{1cm}}] \cup$

Check
